sequently return to their home settlements with their savings. Arabic is the language of the indigenous peoples, but Malay tongues are widely used in the towns of the Hadhramaut. Swahili, the *franca lingua* of East Africa, is understood throughout most of the area, while English is extensively employed in Aden proper. The majority of Arabs are Moslems, belonging to branches of the Sunni sect. Other religions are found chiefly among the different racial groups in the Colony and in the coast towns of the Protectorate.

Education has made considerable progress in the Colony, and is gradually being introduced into the Protectorate. Primary schools for both sexes are supported by the government in the Colony, and by mission and private organizations. The Colonial authorities also operate secondary and vocational schools for boys. There are no post-secondary institutions, but government scholarships are available for the training of teachers and various professional personnel in the Anglo-Egyptian Sudan or in the United Kingdom. The literacy rate among children of 6 to 13 years of age is estimated at 90 per cent, in contrast with 10 to 25 per cent in the general population. A program for the expansion of education

ficiency are widespread. Pellagroid lesions of the skin are often encountered among the peoples of the Protectorate. In a survey of 518 Arab schoolboys in Aden township in 1949, no cases of overt deficiency were found, but enlargement of the liver, possibly suggestive of low protein intake, was revealed in 27 per cent.

Miscellaneous Conditions

A small outbreak of epidemic muscular rheumatism, classified as Bornholm disease, was reported from Aden in 1946. It involved 35 persons—34 British and 1 Arab.

Hepatic cirrhosis is one of the most frequent conditions seen at the Civil Hospital. Local physicians have noted that most of the cases come from malarious regions where qat is widely used, but the underlying causes have not been investigated.

Chewing the leaves of *Catha edulis*, or qat, is a general custom in Western Aden Protectorate. The leaf juices contain a stimulant, and habitual indulgence is said to produce loss of appetite, sleeplessness and a variety of more serious nervous disorders. Local observers believe that addiction to the drug contributes to the widespread undernutrition among the people.

SUMMARY

The Colony of Aden and the adjacent Protectorate, on the southern coast of Arabia, have been British dependencies for over a century. The population of the Colony, including the port of Aden, was enumerated at 80,516 in the census of 1946, and calculated at over 100,000 in 1950. The Protectorate territory comprises two administrative divisions—Western Aden Protectorate and Eastern Aden Protectorate, in which the estimated population for 1948 was about 330,000 and 300,000, respectively. The local governments are tribal and diverse in organization, ranging from sultanates to smaller autonomous units. The inhabitants of both the Colony and the Protectorate are predominantly Arabs and adherents of Islam.
